

a

Open-weight finite-action controls

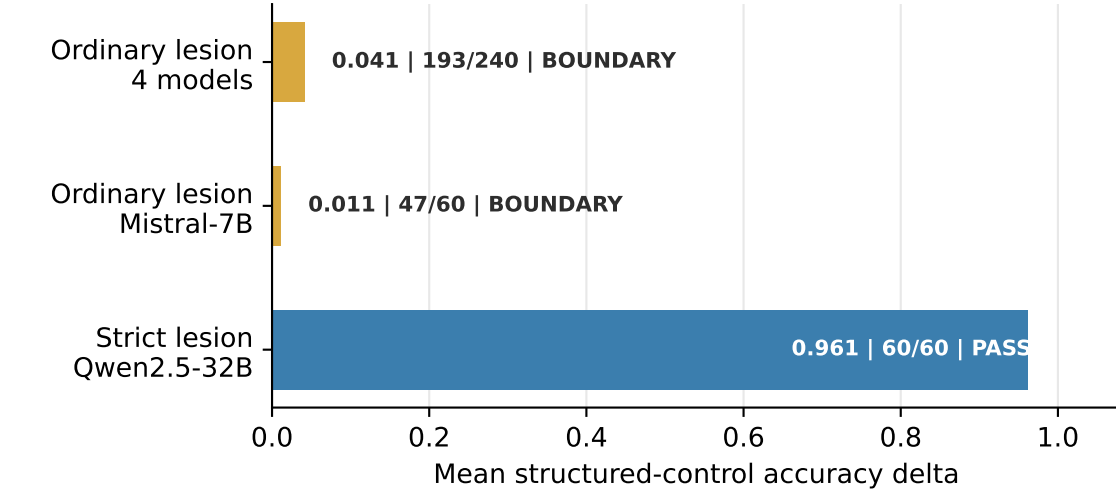

Qwen2.5 sizes plus Mistral; 20 task families and three scaffolds

b

Open-weight state-boundary lesion

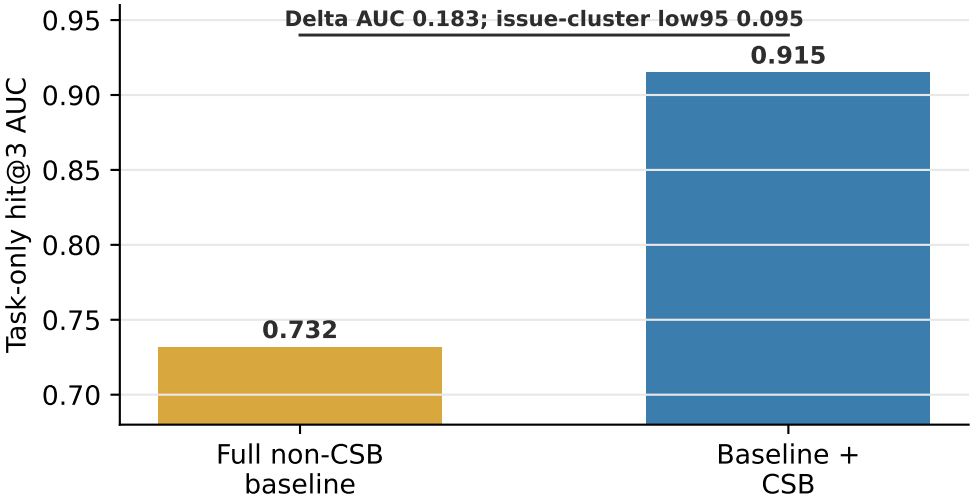

Strict lesion identifies an operational information boundary

c

300-record issue-to-file prediction

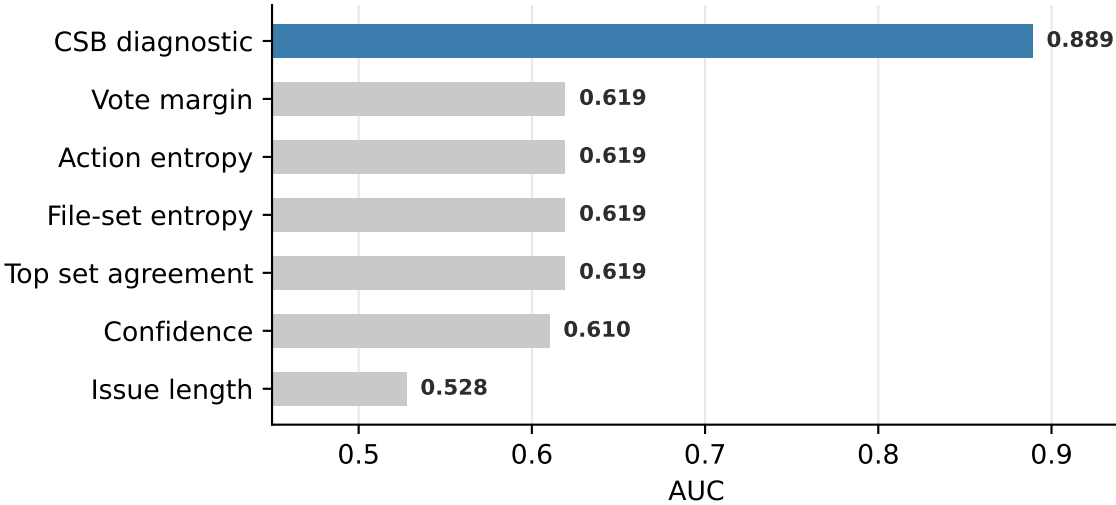

Gold-free baseline; primary outcome uses raw task-only calls

d

Single-predictor baselines

AUC for task-only implementation-file hit@3

e

Issue-cluster sensitivity and secondary guardrails

Primary robustness plus secondary no-violation, clean-hit and wrapper diagnostics

Blue cells are primary positive sensitivities; gold cells are boundary or secondary analyses; grey marks wrapper diagnostics not used as primary evidence.
